[Re: Latvian translation](#)

Hello,

maybe You could tell me how to use one of baltic encodings, in order to see all letters correctly?

Thanks You very much,

Tomas

[Re: Latvian translation](#)

hi,

i have defined correct charset in meta tags. it's windows-1257. it's used in most cases when we use latvian or lithuanian languages. but if it doesn't work in your case you can alternatively try iso-8859-13, because the format seems the same. but if doesn't work either, you can always set encoding using php function header() with appropriate content. it's working for 100%. good luck :)

[Re: Latvian translation](#)

Thank You for Your answer,

could You tell me in which Phorum file should I insert meta tags?

Thanks again

Tomas

[Re: Latvian translation](#)

meta tags you can insert in the language file itself. like:

```
$PHORUM["DATA"]["LANG_META"]=<META content=\"text/html; charset=windows-1257\" http-equiv=\"Content-Type\" />;
```

i am not sure if it really works, but i had no problems.
