[Meta tags](#)

Hallo,

I would like to change charset in order to see all national letters in "subject" field correctly.

Maybe anybody knows where (in which file) should I insert or change meta tags?

Thanks for all answers

[Re: Meta tags](#)

you can change meta tags in every language file, depending on which charset they need. for example:

```
$PHORUM["DATA"]["LANG_META"]=<META content="text/html; charset=windows-1257" http-equiv="Content-Type" />;
```

in the case of baltic languages.

however, i prefer using one charset for all of them - utf8, but it means to convert every of them to utf8.

[Re: Meta tags](#)

Correct national letters need to modify the 1st line of the header.tpl file most likely too (encoding="your_encoding").

[Re: Meta tags](#)

Just a small tip from my side. I run my sites in UTF-8, the standard template of Phorum has a whitespace before the carat.gif. In UTF-8 that turns into something but not a whitespace so remove whitespaces from your template in cases like this.
