Introduce phorum_custom_get_template ?

arkadio / July 01, 2004 04:59PM

[Introduce phorum_custom_get_template ?](#)

I suggest it is a good idea to modify phorum_get_template, so that it can check for existence of custom function for that:

```
=====

function phorum_get_template($page)
{
$PHORUM =& $GLOBALS["PHORUM"];

if(!empty($PHORUM["args"]["template"])) {
$PHORUM["template"]=basename($PHORUM["args"]["template"]);
}

if(isset($PHORUM['user']['user_template'])) {
$PHORUM["template"]=$PHORUM['user']['user_template'];
}

if(empty($PHORUM["template"])){
$PHORUM["template"]=$PHORUM["default_template"];
}

// Check for CUSTOM function
if(function_exists("phorum_custom_get_template")){
return phorum_custom_get_template($page, $PHORUM[template]);
}

$tpl="./templates/$PHORUM[template]/$page";

// check for straight PHP file
if(file_exists("$tpl.php")) {
$phpfile="$tpl.php";
} else {
// not there, look for a template
$tplfile="$tpl.tpl";
$phpfile="$PHORUM[cache]/tpl-$PHORUM[template]-$page-".md5(dirname(__FILE__)).".php";

if(!file_exists($phpfile) || filemtime($tplfile) > filemtime($phpfile)){
include_once "./include/templates.php";
phorum_import_template($tplfile, $phpfile);
}
}
return $phpfile;
}
}
```

[Re: Introduce phorum_custom_get_template ?](#)

for which use? what would you do with such a function?

[Re: Introduce custom_get_template ?](#)

Basically, I am integrating Phorum into a CMS (specifically, MyDMS). I need to output different .tpl segments in at different points and not to show header and footer.

I want to use a buffer to store template output.

Here is a quick solution that works:

```
in phorum_get_template()
```

```
if(function_exists("phorum_custom_get_template")){  
return phorum_custom_get_template($page, $phpfile);  
}  
return $phpfile;
```

and then - see attached file
