[Avatar module](#)

I can't get this module to work. I am not experienced in programming at all and when I try to make the template changes I don't really know what to do and what files to alter. The readme file says there are variables that I can use. How??? It seems this module only works for experienced programmers.

/NF

[Re: Avatar module](#)

Why don't you post your template changes? Make sure your module files are complete and the module has been activated.
