broken thumbnails with embed_images-1.1.3.tar.gz

[broken thumbnails with embed_images-1.1.3.tar.gz](#)

I've had embed_attachments and embed_images running fine for several years. I tried to switch embed_images settings to use JQuery Fancybox and ended up with a "NOT OK" for "download test." Not sure what that's all about. I have a "Virtual Dedicated" server. I could look into it. Or perhaps try to load JQuery locally.

But when I tried to revert to (what I thought was) previous settings all my thumbnails were broken. Each embedded thumbnail now appears as an error box:

Image error

Debug info:

Load local file: 641

Load local image file

Create thumbnail using 0x0 boundary

Original image was 748x422

Thumbnail created at 748x422

Thumbnail MIME type: image/jpeg

OK 748x422 748x422

Not sure what to do. I've been fiddling with settings, getting no where.

Is Load local file: 641 a file_id? When I (from an xterm) look at phorum_files there is no such file_id

Thanks.

RE> "disable debugging"

Thank you. That fixed the thumbnails. I forgot I'd turned that on (which I did when JQuery didn't work).

Now I have to figure out why JQuery fancybox failed (http download test NOT OK). Perhaps I should try loading JQuery locally.

[Re: broken thumbnails with embed_images-1.1.3.tar.gz](#)

http download test has nothing to do with the jquery fancybox. it just can't download the images from the server

itself.

Ah. OK. I thought that meant the system was trying to download the *.js files from Google. Apparently not. I fight with that for a while. At least everything (except fancybox) is working now. I appreciate the help.

[Re: broken thumbnails with embed_images-1.1.3.tar.gz](#)

A) I'm an idiot. I had some embed_images settings set wrong (image size 0, 0)

B) I get a lot of value from phorum, especially for the price (where value is benefit divided by cost).
Thank you.
