resize (imagemagick) images while embed_images uploads

salmobytes / September 18, 2017 10:58PM

[resize \(imagemagick\) images while embed_images uploads](#)

embed_images has "maximum width and height for showing" settings.

Does this mean a large images is uploaded as is but shown at a smaller size?

Wouldn't it be handy to use imagemagick at upload time, in order to knock the image down to a reasonable size before attempting to show it?

Where in embed_images.php would be the right place to intervene, and scale down the just now uploaded image?

[Re: resize \(imagemagick\) images while embed_images uploads](#)

It needs to be written for gd and Imagemagick

Embed images is not where the initial handling happens.

Look at the Hooks.

`\include\posting\action_attachments.php`
