[YALTPH](#)

Yet Another Latest Ten Posts Hack

This is clone of a couple of hacks. It will list the latest 5 posts for all forums contained in folders at the root level. It is designed to run as a complete web page. I have linked mine into the index page in the navigation bar ...

```
<td <?php echo bgcolor($nav_color); ?> valign="TOP" nowrap><?php echo $TopNav; ?>
<!-- yaltpH -->
<a href="recent_posts.php">recent</a>
</td>
```

I plan to add more intelligence, like not showing the users posts, and posts already viewed.

[Re: YALTPH](#)

The script assumes a structure of top level folders under which are forums. If there are no folders the script will flip to the first folder it finds. Will fix later today.

[Re: YALTPH](#)

No handles folderless structure. Thanks to Jesper for testing.

[Variable passed to each\(\) is not an array](#)

Fix for problem if no appends in folder/forum combination.

[Re: YALTPH](#)

does it work with 3.3.2 ? or only with 3.2.11 ?

thanks

marco
